

Dry Powder No Problem for Advanced Detection Systems' ProScan 1600

A large California creamery was looking for a metal detector to handle large 40lb boxes of powdered whey product. Sensitivity in a large opening was key to this project. Advanced Detection Systems supplied a 10" x 26" ProScan 1600 detector on a conveyor. The customer has been extremely satisfied with the results they are getting. We are able to detect 2.5mm stainless steel in their product. The customer's specifications were 3mm stainless steel. This unit has been in service now for more than 6 months and is running smoothly. The customer is pleased with the performance of the unit.

If you have customers with large (or small) applications, call us today! Our metal detector experts tell you about our ProScan Max® III, the most prevalent metal detector requested by the food processing and packaging industry; offering optimum sensitivity in wet, dry and conductive products with optional reject devices to ensure product purity.
